

Shockwave Therapy

A New Treatment For Pain Relief and Healing

Shockwave Therapy uses sound waves of energy which are passed through the skin to the injured part of the body using a special device.

- Clinically proven and highly effective
- Treats soft-tissue injuries and certain bone conditions
- Stimulates cell regeneration
- Increasingly used to treat spasticity

The shockwaves are mechanical and not electric and work by increasing blood flow to the injured area accelerating the body's healing process. After only 3 or 4 treatments with Shockwave Therapy, over 80% of patients report a reduction of pain and start to regain normal function.

Ask about Shockwave Therapy during your next Physiotherapy appointment.
